Summary

Backend Engineer building production systems in fintech and travel — focused on payment workflows, distributed caching, event-driven pipelines, and fault-tolerant microservices using Java, Spring Boot, Kafka, and Redis.

Reduced duplicate financial transactions to zero through end-to-end idempotency and improved API latency by 30% under production load; experience working on high-traffic systems handling real financial transactions with a strong emphasis on correctness, reliability, and performance.

Technical Skills

Languages: Java 8/11/17, SQL
Frameworks: Spring Boot, Spring MVC, Spring Security (JWT / OAuth2 / RBAC), Hibernate / JPA
Distributed Systems: Apache Kafka, Redis (Lua scripting, atomic ops, TTL eviction), Resilience4j
Databases: MySQL (composite indexing, query optimization), MongoDB, stored procedures
Cloud & DevOps: AWS (EC2, API Gateway, CloudWatch, Secrets Manager), Docker, CI/CD, Maven, Git
Observability: Grafana, Swagger / OpenAPI, distributed tracing, HLD / LLD

Experience

R360 Global Services | *Software Engineer* Bangalore, India | May 2023 – Present

Fintech-backed Travel & Rewards platform — microservices serving ICICI Bank and Kotak Mahindra

- Reduced duplicate financial transactions to **zero** by designing end-to-end **idempotency** across the Phicommence payment gateway — covering initiation, async webhook handling, settlement reconciliation, and dead-letter retry workflows.
- Cut API p99 latency by **30%** by introducing **Redis caching** on high-frequency read paths and rewriting N+1 MySQL queries with composite indexes; improvements held under real production traffic spikes.
- Onboarded **Phicommence** as a second live payment provider alongside the existing ICICI Bank settlement flow — zero stored procedure breakage, zero schema migrations, two providers live in parallel from day one.
- Eliminated cascading failures across 4 dependent microservices by applying **Resilience4j** circuit breakers, exponential-backoff retries, and thread-pool bulkheads — a single downstream timeout no longer takes out the caller.
- Built the **iCash Loyalty Engine** — rule-based reward crediting with **atomic Lua scripts in Redis** and SETNX-based initialization, making concurrent reward requests fully idempotent with zero duplicate credits.
- Designed a **Hotel Booking Service** that unified MMT, Cleartrip, Yatra, and Tripsure behind one abstraction — search, pricing, booking, and cancellation through a single interface with per-provider error isolation.
- Improved production incident mean-time-to-detect by setting up **Grafana + CloudWatch** dashboards tracking p50/p99 latency, error rates, and Kafka consumer lag across all services.

Projects

HotelX — Full-Stack Hotel Booking Platform | *Spring Boot, React, MySQL, JWT* hotel-service | hotelx-frontend

- Built a production-style booking system with JWT-secured REST APIs, room availability search, full booking lifecycle, and a React frontend — end-to-end from auth to confirmation.

Order Management Service | *Spring Boot, MySQL, REST APIs* order-service

- Centralized multi-domain order creation, state transitions, and cancellation logic behind a single service with clean layered architecture — mirrors the OMS design used in production.

Coupon & Promotions Engine | *Spring Boot, Redis, MySQL* coupon-service

- Rule-based coupon engine with one-time usage enforcement, customer segmentation, and expiry — idempotency and validation patterns drawn directly from Kotak Rewards production work.

Education

Rajiv Gandhi Proudhyogiki Vishwavidyalaya (RGPV) | *B.E. Computer Science* Bhopal, India | May 2020

Geekster | *Full Stack Java Program* | Oct 2022 – Mar 2023

- Solved **350+ DSA problems** on LeetCode and GeeksforGeeks; shipped Java/Spring Boot/REST API projects.
